

Hadoop task 1:

Install virtual box on your host machine (Linux, Windows)

*****You can install vmware workstation pro if you can crack it. Player only runs a single VM at a time.*****

Create 3 Lubuntu 18.04 VM's

<https://lubuntu.net/lubuntu-18-04-bionic-beaver-released/>

Note: while installing keep the username of all the machines same. Computer name you can assign as you wish. Keeping the same home directory for the machines is necessary. Eg
\$/home/username/hadoop will be the hadoop installation directory on all the machines.

After installing all the machines install openjdk 1.8 or oracle jdk 1.8 on all machines.

Command to check java version:

\$ java -V or java -version

Make sure that the command:

\$ jps

also works

Furthermore you are to submit a document with details of the steps you followed.

You are playing with VM's. Nothing will happen to your PC. It **will not** blow up, catch on fire, disintegrate, obliterate into oblivion, fly away and won't certainly hit you back. Go all out.
